PROFESSIONAL SUMMARY

Computer Science undergraduate with hands-on experience in CI quality gates, defect diagnosis and documentation, and requirements and use case analysis. Seeking a 6-12-month QA internship.

EDUCATION

Informatics Institute of Technology (IIT) – BSc (Hons) Computer Science · Year 3 of 4 · Expected graduation: 2024 – Present 2028

Modules – Object-Oriented Programming (Java/Python), Databases, Client-Server Architecture, Web Development

TECHNICAL SKILLS

Testing & QA: GitHub Actions (CI lint, type-check, build), Postman, SQL, API Testing, Test Cases, Bug Tracking
Languages: Java, Python, TypeScript, JavaScript, C# (Unity), HTML, CSS, OOP
Frameworks & Libraries: Next.js, React, Node.js, Express.js, Prisma ORM
Databases: PostgreSQL, Redis, SQL
Other: Docker, GitHub Actions, Git, Linux, Bash, Unity 6, Blender, MS Office

PROJECTS

OreanStudio (Orean 360 Platform)

2025 – 2026

Technologies: Next.js, Node.js, TypeScript, ESLint, Express.js, PostgreSQL, BullMQ, Redis, Docker, GitHub Actions, Kubernetes, Terraform, Helm

- Built a GitHub Actions CI workflow for a Node.js/TypeScript codebase that runs ESLint, TypeScript type-checking and Docker build verification on every pull request to dev, staging and main; extended the pipeline with Prisma migrations and Helm deployments with rollout verification and automatic rollback.
- Diagnosed and resolved 23 documented issues across two projects (symptom, root cause, fix), including unprotected dashboard routes, a liveness-probe path mismatch that caused pod restarts, and an exposed API key (revoked and purged from git history with git filter-repo).
- Defined use case specifications with main, alternate, and exception flows as the basis for test cases.
- Executed manual functional tests for 8 requirements, plus cross-browser (Chrome, Firefox, Edge) and responsive testing that found dashboard layout defects on small screens.
- Built and shipped a social media automation SaaS platform, collaborating in a 6-member Agile/Scrum team across the full development lifecycle.
- Cut the frontend Docker image from 1.5 GB to ~150 MB (90%) using a three-stage node:20-alpine build.
- Provisioned cloud infrastructure with Terraform using separate workspaces per environment; staging runs the same container images as production.

GEO Engine (Zero-Cost LLM Pipeline)

2025 – 2026

Technologies: Python, Playwright, Firecrawl, Qwen2.5, vLLM, PyTorch, Unsloth, Docker Compose, WSL2, Modal

- Cleaned and validated scraped data (minimum-length filter, deduplication, spam and all-caps removal, PII stripping) down to 374 records, formatted as ChatML and split 299/37/38 into train, validation and held-out test sets.
- Fine-tuned Qwen2.5-7B-Instruct with LoRA (Unsloth, 4-bit) on a free Colab T4 (training loss 1.84 to 0.96) and served it with vLLM on Modal with scale-to-zero, within free credit tiers.
- Built a rate-limited data-collection Python pipeline with self-hosted Firecrawl in Docker, slimmed for a desktop (pre-built ghcr.io images, FoundationDB removed, relaxed RabbitMQ health checks).

3D Interactive Arcade Simulator

2025

Technologies: C# (Unity), Unity 6, Blender

- Identified and logged defects across physics edge cases through structured playtesting of collision behaviour across all game modes, for a LEGO-themed first-person arcade simulator with 3 mini-games built in a 3-member team.
