PROFESSIONAL SUMMARY

Computer Science undergraduate who built and deployed a full-stack SaaS platform on GKE in a 6-person Agile team, using TypeScript, Terraform, Helm and GitHub Actions.

EDUCATION

BSc (Hons) Computer Science, University of Westminster, delivered at IIT – Year 3 of 4 · Expected graduation: 2028 2024 – Present

Modules – Object-Oriented Programming (Java/Python, Data Structures & Algorithms), Databases, Client-Server Architecture, Web Development

TECHNICAL SKILLS

Languages: TypeScript, Python, Java, JavaScript, SQL, HTML, CSS, Bash
Web & Backend: Node.js, Express.js, Next.js, React, REST APIs, Prisma ORM, Zod
Cloud & DevOps: Kubernetes, GKE, Docker, Terraform, Helm, GitHub Actions, Linux
Databases: PostgreSQL, Redis
Tools: Git, Postman, Blender, Unity

PROJECTS

OreanStudio (Orean 360 Platform) 2025 – 2026

Technologies: Next.js, Node.js, Express.js, TypeScript, PostgreSQL, Prisma, Kubernetes, GKE, Terraform, Helm, GitHub Actions, Docker

- Built a Next.js 16 frontend and a Node.js 20 / Express 5 REST API in TypeScript (Prisma ORM, JWT auth, Zod validation) on a 14-model PostgreSQL schema.
- Built the post-creation, Kanban board, due-date update and calendar date-range endpoints, plus social-token disconnection.
- Contributed to six OAuth integrations (Google, YouTube, Meta, LinkedIn, TikTok, WhatsApp) with BullMQ workers for scheduled publishing and FFmpeg video transcoding.
- Provisioned cloud infrastructure including GCP subnets, Artifact Registry, and GKE node pools with Terraform (IaC).
- Automated DB migrations and Helm chart deployments to GKE via GitHub Actions CI/CD (with atomic rollback), and implemented KEDA-driven autoscaling.
- Configured Kubernetes liveness/readiness probes and monitored cluster health to diagnose and resolve pod restart loops.
- Cut the frontend Docker image from 1.5 GB to ~150 MB (90%) using a three-stage node:20-alpine build.
- Collaborated with a 6-member engineering team using Agile/Scrum practices to design and deliver the platform.

GEO Engine (Zero-Cost LLM Pipeline) 2025 – 2026

Technologies: Python, PyTorch, Unsloth, Qwen2.5, LoRA, vLLM, Firecrawl, Docker

- Cleaned and validated scraped data (minimum-length filter, deduplication, spam and all-caps removal, PII stripping) down to 374 records, formatted as ChatML and split into train, validation and test sets.
- Fine-tuned Qwen2.5-7B-Instruct with LoRA (Unsloth, 4-bit) on a free Google Colab T4 GPU (training loss 1.84 to 0.96) and served it with vLLM on Modal with scale-to-zero.
- Built a rate-limited data-collection Python pipeline with self-hosted Firecrawl in Docker to gather the training dataset.

Modly Blender Extension 2025

Technologies: Python, Blender Python API (bpy), FastAPI

- Developed a Blender 5.2 add-on integrating Modly's local AI 3D generation via a custom Node Graph, with an isolated FastAPI backend to prevent GPU conflicts.

3D Interactive Arcade Simulator 2025

Technologies: C# (Unity), Unity 6, Blender

- Shipped a LEGO-themed first-person arcade simulator with 3 playable mini-games in Unity 6.
- Programmed a custom first-person controller and physics-based elastic collisions in C#.
